TOPIC
UNSAFE DEVICES AND ENVIRONMENTS

Demostration

Colombia is the 16th country in the list according to Kaspersky of the countries with the most cyber attacks

WHY ARE THEY ATTACKING US?

The simple fact of obtaining data such as ages, professions, customs, tastes in entertainment, music, fashion, etc. This can favor foreign companies or intelligence companies from other places to sell us a product or learn about our weaknesses.

Weaknesses

ERROR 1

In the cyber world there is a constant war for which our first mistake is not being aware that we are at risk.

ERROR 2

Another constant mistake is to think that there are places that cannot be attacked, such as food companies, hospitals or veterinarians, for example, but relevant data of a society can also be extracted from these places.

ERROR 3

Self-care is the most common mistake as it leads to social engineering and other types of attacks that are easy to avoid.

Resources

We have different types of defenses available, you have to know that for each device there is a different defense method, for example, for a university a different defense is used than for a soft drink company, therefore it is to be aware of the defenses that we have for our devices.

but in the end the most important thing is to avoid vulnerabilities and layer 8 errors (human error) since this is the bridge most used by attackers worldwide.
